ADDENDUM

Personal Programming

The following additions and corrections should be made to your Personal Programming manual.

As shown on page IV-6, a straightforward method for entering a variable in a program is to stop the program with an R/S instruction. Ordinarily, the program will continue at the next instruction when the R/S key is pressed to restart the program. However, this automatic advance to the next instruction is cancelled if a Solid State Software program is called or if a Conversion or Statistics keyboard function is used while the program is stopped. In these cases the R/S key must be pressed twice to restart the program. Conversions and Statistics functions are described on pages V-30 through V-40.

You should note that the pending-operation registers used by Conversions and Statistics functions are the same registers used by the alphanumeric printing operations. Be sure alphanumeric data entered with 2nd 03 or 2nd 04 is printed before using Conversion or Statistics functions. Also note that 2nd 00 through 2nd 05 will discard the fractional part of the number in the display register in the same manner as the integer key.
